COURSE ASSIGNMENT REPORT

Hostel Complaint Management System

A Cloud-Based Software-as-a-Service (SaaS) Application Built on Zoho Creator

Course: CSA1516 – Cloud Computing and Big Data Analytics

Topic 1 – Cloud-Based Hostel Complaint Management System

Submitted by

Vino Aldrin E

Register No.: 192511481

B.E. Computer Science and Engineering

Course Faculty / Guide: Dr. K. Santhiya Lakshmi

Academic Year: 2026 – 2027

Date of Submission: 02-Sep-2026

Assignment Information

Department	Computer Science and Engineering
Programme	B.E. – Computer Science and Engineering
Course Code & Course Name	CSA1516 – Cloud Computing and Big Data Analytics
Academic Year / Batch	2026 – 2027
Faculty Name	Dr. K. Santhiya Lakshmi
Assignment Title	Cloud-Based Hostel Complaint Management System using Zoho Creator (SaaS)
Date of Issue	25-Aug-2026
Date of Submission	02-Sep-2026
Maximum Marks	100
Course Outcome(s) – CO	CO5 – Apply cloud service models (IaaS / PaaS / SaaS) to design and deploy a cloud-based application for a real-world problem
Bloom's Taxonomy Level	Apply / Create (Level 3 – Level 6)
SDG Mapping (SDG 1–17)	SDG 9 – Industry, Innovation and Infrastructure; SDG 11 – Sustainable Cities and Communities
Industry / Societal Relevance	Digitises grievance redressal for hostel and campus facility management, reflecting real SaaS practices used in institutional service-desk systems

1. Problem Statement

Hostels in an educational institution receive a continuous stream of day-to-day maintenance complaints from resident students — electrical faults, plumbing leaks, room-maintenance issues, and cleanliness lapses. When such complaints are handled manually through registers or verbal reporting, they are difficult to track, easy to lose, and impossible to analyse for recurring patterns. There is no shared, real-time view of how many complaints are pending, which ones are being worked on, and which have been resolved.

This assignment requires the design and development of a **simple cloud-based Hostel Complaint Management System** using **Zoho Creator**, a low-code Platform/Software-as-a-Service (PaaS/SaaS) offering, to demonstrate the SaaS delivery model of cloud computing. The system must allow students to submit hostel-related complaints (electrical, plumbing, room maintenance, cleanliness) through an

online form, store the complaints in the cloud, organise them by **complaint type, priority and status**, and provide a dashboard/report that tracks and analyses the number of complaints in each category.

2. Objective

The objective of this assignment is to apply the concepts of cloud computing — specifically the Software-as-a-Service (SaaS) model — to build a working, cloud-hosted application without provisioning or managing any physical or virtual infrastructure. Specifically, this work aims to:

- Understand and demonstrate the SaaS model of cloud computing through a hands-on, real-world application.
- Design and develop a cloud-based Hostel Complaint Management System entirely on the Zoho Creator low-code platform.
- Enable students to submit hostel-related complaints (electrical, plumbing, room maintenance and cleanliness) through an online form accessible from any browser.
- Store submitted complaints securely in the cloud and organise them by complaint type, priority and status.
- Provide a dashboard and report that track submitted complaints and analyse the number of complaints per category in real time.
- Evaluate the advantages and limitations of a low-code/SaaS approach compared with a traditionally coded, self-hosted system.

3. Requirements and Environment Used

3.1 Functional Requirements

- An online complaint-submission form capturing Student Name/ID, Hostel/Room Number, Complaint Type, Complaint Description, Date, and Priority.
- Automatic, cloud-based storage of every submitted complaint (no manual data entry into a separate system).
- Classification of complaints by Complaint Type (Electrical, Plumbing, Room Maintenance, Cleanliness), by Priority (High, Medium, Low) and by Status (Pending, In Progress, Resolved).
- A tabular report listing every complaint with all its fields.
- A dashboard summarising complaint counts by status, a pie chart of complaint-type distribution, and a priority-wise breakdown.

- A category-wise (Complaint Types) grouped view and a Calendar view organised by complaint date.

3.2 Non-Functional Requirements / Constraints

- Availability – the application must be reachable from any device with a browser and an internet connection, with no local installation.
- Usability – the complaint form must be simple enough for any student to fill without training.
- Scalability – the platform must be able to accommodate an increasing number of complaints and hostel blocks without redesign.
- Security – complaint data must be stored on secure, access-controlled cloud servers rather than on a local, unprotected file.
- Cost – the solution must not require the purchase or maintenance of dedicated servers (a key SaaS/PaaS constraint for this assignment).
- Time – the system had to be designed, built and tested within the assignment timeframe, which favoured a low-code approach over custom coding.

3.3 Environment and Tools Used

Category	Tool / Technology Used
Cloud Application Platform	Zoho Creator (Low-code PaaS used to build and deliver the app as SaaS)
Cloud Hosting / Storage	Zoho cloud data centres (application server + database managed entirely by Zoho)
Client / Access	Google Chrome web browser (desktop view); Zoho Creator also supports tablet and mobile layouts
Connectivity	Standard broadband / campus internet connection (HTTPS)
Sample Dataset	10 sample complaint records for Noyyal Hostel, used to populate and test the application (see Section 6.3)
Documentation	Microsoft Word, screenshots captured directly from the deployed Zoho Creator application

4. Design / Proposed Solution

The proposed solution treats the Hostel Complaint Management System purely as an application built and consumed **on top of a SaaS platform** — no server, operating system, runtime or database was installed or configured manually. Zoho Creator was used to model the data, build the user-facing form,

and auto-generate the report, dashboard, category and calendar views from the same underlying cloud dataset.

4.1 Three-Layer Architecture

Fig. 4.1 — Three-layer SaaS architecture of the Hostel Complaint Management System

- Client Layer – any student or warden opens the application in a web browser (desktop or mobile); nothing is installed locally.
- Application Layer (SaaS) – the Zoho Creator app “Hostel_Complaint_Management_Zoho_Import” hosts the Form, Report, Dashboard, Complaint Types and Calendar modules.
- Cloud Data Layer – Zoho's cloud servers store every complaint record, handle backups, and are fully managed by the provider, which is the defining characteristic of the SaaS model.

4.2 Application Modules

Module	Purpose
Complaint Form	Captures a new complaint: Student ID, Student Name, Hostel Name, Room Number, Complaint Type, Complaint Description, Complaint Date, Priority, Status.
Report	A live, sortable tabular view of every complaint stored in the cloud, used for day-to-day tracking.
Dashboard	KPI cards for In-Progress / Resolved / Pending / Total counts, a pie chart of complaint-type distribution, and a priority-wise summary.
Complaint Types	A category-grouped (Kanban-style) view that clusters complaints under Plumbing, Cleanliness, Room Maintenance and Electrical.
Calendar	Displays complaints on the date they were raised, useful for spotting daily/weekly complaint load.

4.3 Data Fields

Field	Type	Notes
Student ID	Single Line	Unique identifier, e.g. 25CSE001
Student Name	Name	First name of the complainant
Hostel Name	Single Line	Defaults to “Noyyal Hostel” for this demonstration
Room Number	Single Line	e.g. A-203, B-105
Complaint Type	Dropdown	Electrical / Plumbing / Room Maintenance / Cleanliness
Complaint Description	Single Line	Free-text description of the issue
Complaint Date	Date (dd-MMM-yyyy)	Date the complaint was raised
Priority	Radio Button	High / Medium / Low
Status	Picklist	Pending / In Progress / Resolved

5. Algorithm / Pseudocode / Flowchart

Since the system is built on a low-code SaaS platform rather than hand-written server code, the “algorithm” takes the form of the workflow the platform executes whenever a complaint moves through the system. This is expressed below as pseudocode and as an equivalent flowchart.

5.1 Pseudocode – Complaint Lifecycle

```
BEGIN
  Student opens Hostel Complaint Management App (SaaS, via browser)
  Student ENTERS: StudentID, StudentName, HostelName, RoomNumber
  Student SELECTS: ComplaintType {Electrical, Plumbing,
                                Cleanliness, RoomMaintenance}
  Student ENTERS: ComplaintDescription, ComplaintDate
  Student SELECTS: Priority {High, Medium, Low}
  Student SUBMITS the form
  IF all mandatory fields are valid THEN
    System STORES the record in the cloud database
    SET Status = "Pending"
  ELSE
    System DISPLAYS validation error, request is not saved
  END IF

  Warden / Admin OPENS Report / Dashboard / Complaint Types / Calendar
  WHILE complaint is not resolved
    IF work has started on the complaint THEN
      UPDATE Status = "In Progress"
    IF issue has been fixed THEN
      UPDATE Status = "Resolved"
    END WHILE

  ON every INSERT or UPDATE:
    Dashboard RECOMPUTES count of Pending, In Progress, Resolved
    Dashboard REDRAWS pie chart of ComplaintType distribution
```

5.2 Flowchart

Fig. 5.1 — Flow of a complaint from submission to dashboard update

6. Implementation / Source Code

Zoho Creator is a **low-code** SaaS platform, so the “source code” of this project is expressed mainly as **declarative application configuration** (fields, forms, views and layouts) rather than hand-written server-side code. The implementation steps carried out are listed below, followed by the field configuration and the sample dataset used to populate and test the application.

6.1 Implementation Steps

- Created a new application named “Hostel_Complaint_Management_Zoho_Import” in the Zoho Creator workspace (SaaS account creatorapp.zoho.com/zoho_vino15/).
- Built the base form with the nine fields listed in Section 4.3, setting “Student ID” and “Complaint Type” as mandatory fields.
- Configured the “Complaint Type” field as a Dropdown with options Electrical, Plumbing, Room Maintenance and Cleanliness.
- Configured “Priority” as a Radio Button field with options High, Medium and Low, and “Status” as a Picklist with options Pending, In Progress and Resolved.

- Auto-generated the tabular Report view from the same form, which lists every stored complaint record.
- Built the Dashboard page using built-in widgets: count widgets for In Progress / Resolved / Pending / Total, and a pie chart widget bound to the “Complaint Type” field.
- Created the Complaint Types page as a category (Kanban-style) view, grouped by the “Complaint Type” field.
- Created the Calendar page, mapping each complaint to its “Complaint Date” field.
- Imported / entered 10 sample complaint records (see Section 6.3) to populate and test the application end-to-end.
- Published the application and verified that the Form, Report, Dashboard, Complaint Types and Calendar views all reflect the same live cloud dataset.

6.2 Field Configuration Logic (Deluge-equivalent Behaviour)

Zoho Creator's built-in field behaviour removes the need for most custom scripting for a form of this size. The platform natively performs the following, which would otherwise need to be hand-coded on a traditional (non-SaaS) stack:

- Mandatory-field validation on Student ID and Complaint Type before a record can be submitted.
- Automatic default value (“Noyyal Hostel”) pre-filled into the Hostel Name field.
- Automatic aggregation (COUNT/GROUP BY equivalent) for the Dashboard's status counts, pie chart and priority totals — recalculated instantly whenever a record is added, edited or deleted.
- Automatic view generation — the Report, Complaint Types and Calendar pages all stay in sync with the Form without any additional query being written.

6.3 Sample Dataset Used

The following 10 records (Noyyal Hostel) were used to build, populate and test the application end-to-end:

Student ID	Name	Room	Type	Description	Date	Priority
25CSE001	Rahul Kumar	A-203	Electrical	Ceiling fan not working	02-Sep-2026	High
25CSE002	Priya S	A-204	Plumbing	Water leakage near wash basin	02-Sep-2026	High

25CSE003	Arun Kumar	B-105	Cleanliness	Room cleaning has not been done	01-Sep-2026	Medium
25CSE004	Divya R	B-210	Room Maintenance	Door lock is damaged	01-Sep-2026	High
25CSE005	Karthik M	C-112	Electrical	Tube light is not working	31-Aug-2026	Low
25CSE006	Sneha P	C-118	Plumbing	Bathroom tap is leaking	31-Aug-2026	Medium
25CSE007	Vignesh R	D-201	Cleanliness	Dustbin has not been cleared	30-Aug-2026	Low
25CSE008	Harini S	D-207	Room Maintenance	Window handle is broken	30-Aug-2026	Medium
25CSE009	Ajay K	E-102	Electrical	Power socket is loose	29-Aug-2026	High
25CSE010	Meena V	E-115	Cleanliness	Common area requires cleaning	29-Aug-2026	Medium

7. Test Cases and Expected / Actual Results

The application was tested manually by exercising the Form, Report, Dashboard, Complaint Types and Calendar views after populating the 10-record sample dataset. All test cases produced the expected results, confirming that the SaaS application behaves consistently end-to-end.

ID	Test Description	Expected Result	Actual Result	Status
TC01	Submit a complaint with all fields filled correctly	Record is saved and appears in the Report	Record 25CSE001 saved and visible in Report	Pass
TC02	Submit the form leaving a mandatory field (Student ID) blank	Form blocks submission with a validation message	Submission blocked until Student ID was entered	Pass
TC03	Open Dashboard after all 10 records are added	Counts show Total = 10, Pending = 4, In Progress = 3, Resolved = 3	Dashboard displayed Total 10, Pending 4, In Progress 3, Resolved 3	Pass
TC04	Check Priority split on Dashboard	High = 4, Medium = 4, Low = 2	Dashboard displayed High 4, Medium 4, Low 2	Pass
TC05	Open Complaint Types page and check grouping	Records grouped correctly: Plumbing 2, Cleanliness 3, Room Maintenance 2, Electrical 3	All 10 records grouped correctly under the four categories	Pass
TC06	Open Calendar and check complaints appear on their Complaint Date	Each complaint appears under its correct date in September/August 2026	All records appeared under the correct dates on the Calendar	Pass
TC07	Update a record's Status from Pending to In Progress	Dashboard counts update automatically without a manual refresh of any other page	Dashboard counts updated instantly across Report and Dashboard	Pass
TC08	Access the application from a different device/browser session	Same live data is visible — confirms cloud (not local) storage	Identical data visible, confirming SaaS/cloud storage	Pass

8. Execution Screenshots / Output

The following screenshots were captured directly from the deployed, live Zoho Creator application, confirming that it is genuinely hosted and running in the cloud (note the application URL in the browser's address bar in each figure).

Fig. 8.1 — Dashboard: status KPI cards, complaint-type pie chart, and priority summary

The table displays the following data:

Student ID	Student Name	Hostel Name	Room Number	Complaint Type	Complaint Description	Complaint Date	Priority	Status
25CSE010	Meena V	Noyyal Hostel	E-115	Cleanliness	Common area requires cleaning	29-Aug-2026	Medium	In Progress
25CSE009	Ajay K	Noyyal Hostel	E-102	Electrical	Power socket is loose	29-Aug-2026	High	Resolved
25CSE008	Harini S	Noyyal Hostel	D-207	Room Maintenance	Window handle is broken	30-Aug-2026	Medium	Pending
25CSE007	Vignesh R	Noyyal Hostel	D-201	Cleanliness	Dustbin has not been cleared	30-Aug-2026	Low	Resolved
25CSE006	Sneha P	Noyyal Hostel	C-118	Plumbing	Bathroom tap is leaking	31-Aug-2026	Medium	Pending
25CSE005	Karthik M	Noyyal Hostel	C-112	Electrical	Tube light is not working	31-Aug-2026	Low	Resolved
25CSE004	Divya R	Noyyal Hostel	B-210	Room Maintenance	Door lock is damaged	01-Sep-2026	High	In Progress
25CSE003	Arun Kumar	Noyyal Hostel	B-105	Cleanliness	Room cleaning has not been done	01-Sep-2026	Medium	Pending
25CSE002	Priya S	Noyyal Hostel	A-204	Plumbing	Water leakage near wash basin	02-Sep-2026	High	In Progress
25CSE001	Rahul Kumar	Noyyal Hostel	A-203	Electrical	Ceiling fan not working	02-Sep-2026	High	Pending

Fig. 8.2 — Dashboard (scrolled): embedded tabular report of all complaints

The screenshot shows a web application titled "Hostel_Complaint_Management_Zoho_Import". The navigation bar includes "Dashboard", "Hostel_Complaint_Managem...", "Complaint Types", and "Calendar". The main form is titled "Hostel_Complaint_Management_Zoho_Import" and contains the following fields:

- Student ID:** A text input field.
- Student Name:** A text input field with a "First Name" label below it.
- Hostel Name:** A text input field with "Noyyal Hostel" entered.
- Room Number:** A text input field.
- Complaint Type:** A dropdown menu with "-Select-" selected.
- Complaint Description:** A text input field.
- Complaint Date:** A date picker showing "dd-MMM-yyyy".
- Priority:** Radio buttons for "High", "Low", and "Medium".

Fig. 8.3 — Complaint submission form used by students to raise a new complaint

The screenshot shows the "Hostel_Complaint_Management_Zoho_Import Report" view. It displays a table with 10 complaint records. The table has the following columns: Student ID, Student Name, Hostel Name, Room Number, Complaint Type, Complaint Description, Complaint Date, Priority, and Status. The records are as follows:

Student ID	Student Name	Hostel Name	Room Number	Complaint Type	Complaint Description	Complaint Date	Priority	Status
25CSE010	Meena V	Noyyal Hostel	E-115	Cleanliness	Common area requires cleaning	29-Aug-2026	Medium	In Progress
25CSE009	Ajay K	Noyyal Hostel	E-102	Electrical	Power socket is loose	29-Aug-2026	High	Resolved
25CSE008	Harini S	Noyyal Hostel	D-207	Room Maintenance	Window handle is broken	30-Aug-2026	Medium	Pending
25CSE007	Vignesh R	Noyyal Hostel	D-201	Cleanliness	Dustbin has not been cleared	30-Aug-2026	Low	Resolved
25CSE006	Sneha P	Noyyal Hostel	C-118	Plumbing	Bathroom tap is leaking	31-Aug-2026	Medium	Pending
25CSE005	Karthik M	Noyyal Hostel	C-112	Electrical	Tube light is not working	31-Aug-2026	Low	Resolved
25CSE004	Divya R	Noyyal Hostel	B-210	Room Maintenance	Door lock is damaged	01-Sep-2026	High	In Progress
25CSE003	Arun Kumar	Noyyal Hostel	B-105	Cleanliness	Room cleaning has not been done	01-Sep-2026	Medium	Pending
25CSE002	Priya S	Noyyal Hostel	A-204	Plumbing	Water leakage near wash basin	02-Sep-2026	High	In Progress
25CSE001	Rahul Kumar	Noyyal Hostel	A-203	Electrical	Ceiling fan not working	02-Sep-2026	High	Pending

Showing 10 of 10

Fig. 8.4 — Full report view showing all 10 stored complaint records

Fig. 8.5 — Complaint Types view: complaints grouped by category (Plumbing, Cleanliness, Room Maintenance, Electrical)

Fig. 8.6 — Calendar view: complaints organised by the date they were raised

9. Analysis and Discussion

9.1 Interpreting the Dashboard Data

Across the 10 sample complaints raised for Noyyal Hostel, the dashboard computed the following breakdown automatically, without any manual counting:

- Status: 4 Pending (40%), 3 In Progress (30%), 3 Resolved (30%) — out of 10 total complaints.
- Priority: 4 High, 4 Medium, 2 Low — showing that 40% of open issues (electrical faults, water leakage, damaged locks) were flagged as urgent.
- Complaint Type: Electrical and Cleanliness each account for 3 complaints, Plumbing and Room Maintenance 2 each — indicating electrical and cleanliness issues are the most frequently reported categories in this sample and would be the first areas a hostel administration should prioritise for preventive maintenance.

Because these figures are computed live from the underlying cloud dataset, any new complaint immediately shifts the pie chart and KPI cards — this is a direct, observable benefit of the SaaS approach over a manually maintained register or spreadsheet, where such recalculation would need to be done by hand.

9.2 Why a SaaS / Low-Code Approach Was Chosen

Three broad approaches were considered before settling on Zoho Creator:

- **Custom-coded web application (e.g., PHP/MySQL or a MERN stack)** — offers full control over logic and UI, but requires provisioning a server (IaaS/PaaS), writing and testing form-handling, database and reporting code, and maintaining security patches — far beyond the scope and time available for this assignment.
- **Spreadsheet-based tool (Google Forms + Google Sheets)** — quick to set up and free, but lacks a built-in dashboard, category-grouped view and calendar out of the box; charts and status tracking would need to be built manually.
- **Low-code SaaS platform (Zoho Creator)** — chosen for this assignment because it directly demonstrates the SaaS delivery model: the provider manages the servers, database, security and uptime, while the developer focuses only on the application's data model and views. It also natively supplies the dashboard, report, category and calendar views the problem statement asks for, with no separate charting library or backend code required.

9.3 Advantages Observed

- On-demand self-service — the application was created and published without raising any IT infrastructure request or provisioning a server.
- Broad network access — the same live data was verified to be accessible from different browser sessions/devices (TC08), consistent with the SaaS characteristic of ubiquitous access.
- Rapid elasticity — adding new fields, views or sample records required no re-deployment step; the platform absorbed the changes instantly.
- Reduced development time — the entire form, report, dashboard, category view and calendar were built and tested well within the assignment timeframe, which would be difficult with a hand-coded solution.

9.4 Limitations and Trade-offs

- Customisation ceiling — highly specific UI/UX requirements or complex business logic would eventually need Zoho's Deluge scripting or a custom-coded platform; the low-code approach trades some flexibility for speed.
- Platform / vendor dependency — the application's availability and future pricing depend entirely on Zoho as the SaaS vendor (a form of vendor lock-in inherent to SaaS).
- Connectivity dependency — without internet access, students cannot submit or view complaints, unlike a purely offline register.
- Free/trial-tier limits — the number of users, records or storage on a free Zoho Creator plan is capped, which would need a paid subscription for real hostel-wide deployment.

9.5 Broader Considerations

- Sustainability / Environment — replacing a paper complaint register with a cloud form reduces paper usage and physical storage.
- Accessibility — any student with a browser and internet connection, on any device, can raise or check a complaint, improving accessibility over a register kept at a single physical desk.
- Data security / privacy — complaint data (including student identifiers) resides on Zoho's access-controlled, encrypted cloud infrastructure rather than an unprotected paper register or shared spreadsheet.
- Societal / industry relevance — the same pattern (a low-code SaaS form + dashboard) is used by real facility-management and IT service-desk systems, aligning this assignment with SDG 9 (Industry, Innovation and Infrastructure) and SDG 11 (Sustainable Cities and Communities) by supporting smarter, more responsive campus infrastructure.

10. Conclusion

This assignment successfully designed and implemented a cloud-based Hostel Complaint Management System entirely on the Zoho Creator SaaS platform, meeting every requirement in the problem statement. Students can raise electrical, plumbing, room-maintenance and cleanliness complaints through a simple online form; every complaint is stored in the cloud and automatically organised by complaint type, priority and status; and a live dashboard, report, category view and calendar together provide a simple, effective way to track and analyse complaints without any manual tallying.

Testing with a 10-record sample dataset (Section 6.3 and Section 7) confirmed that the Form, Report, Dashboard, Complaint Types and Calendar views all remain synchronised in real time, and that the platform correctly enforces mandatory-field validation. The exercise concretely demonstrated the core characteristics of the SaaS model — on-demand self-service, broad network access, and a fully provider-managed backend — while also surfacing realistic trade-offs such as reduced customisation and dependency on the SaaS vendor.

Within the scope of this assignment, the system meets its stated requirements; the limitations identified in Section 9.4, and the enhancements discussed in Section 11, outline a clear path for extending it into a production-ready hostel-management tool.

11. Student Reflection

Working on this assignment gave me a much more concrete understanding of cloud computing than reading about it in theory. Building the Hostel Complaint Management System on Zoho Creator showed me, hands-on, what it actually means for an application to be delivered as a Software-as-a-Service: I never had to think about servers, operating systems or databases — I only had to design the fields, the form and the views, and the platform took care of storage, availability and computation. This made the difference between SaaS and traditional, self-hosted software very tangible rather than just a definition to memorise.

I also learned how a single underlying dataset can power multiple views — a form, a report, a dashboard with charts, a category-grouped board and a calendar — without writing separate code for each one, and how quickly a working, testable cloud application can be produced this way. Designing the dashboard also made me think about which numbers actually matter to someone managing a hostel — status counts, priority split and category distribution — rather than just displaying raw data.

If I had more time and resources, I would extend the system with automatic email/SMS notifications to students when their complaint status changes, role-based logins so wardens and students see different

views, a complaint-escalation rule for issues left “Pending” beyond a set number of days, the ability to upload a photo of the issue at submission time, and a short feedback/rating step once a complaint is marked Resolved. Together these would move the project from a working demonstration of the SaaS model to something closer to a system a real hostel could depend on day to day.

12. Individual Contribution of Group Members

This is an individual assignment completed independently by the student named below.

Name	Register No.	Contribution
Vino Aldrin E	192511481	Problem analysis, application design (data model, architecture and module design), complete implementation on Zoho Creator (form, report, dashboard, complaint-type and calendar views), sample-data population, end-to-end testing, and preparation of this report.
